lecture 21

- lower bound for comparison based Sorbing
- linear time sorting (not comparison-- counting sort

 bucket sort
- more probability (independent events)

Q: Is it possible to have a comparison based sorting algorithm that takes O(n) time ?

A: No, We will show that all Comparison based sorting algorithms take at least an loga time on some input.

To motivate the argument, lets think about a problem where you need to ask a certain number of questions to solve the problem - that is,
you face an information theoretic lower bound.

Comparison based Sorting

The sorting algorithms you have seen are all based on pairwise comparisons between elements

O(n2)

O(nlogn)

- · jusertion sort
- · heap sort
- · selection sort
- · mergesort
- bubble sort
- · quick sort

Recall from COMP 250

O() asymptotic upper bound

IL() asymptotic lower bound

O() asymptotic upper & lower bound

COMP 250/251 are mostly concerned with O()

But I and @ are very commonly used too.

The game "20 questions" http://en.wikipedia.org/wiki/Twenty_Questions

- · Player A thinks of an object
- · Player B asks yes/no questions about the object
- · Good strategy for player 13 is to ask questions that partition the set of possible solutions into two equal size sets

How do computer scientists play 20 questions

A: "I am thinking of a number between 0 and 2²⁰-1."

http://www.cim.mcgill.ca/~langer/250/2-binary.pdf

B's strategy:

Binary search! Essentially B would ask about each bit in the binary representation of the number.

How is "m questions" relevant to comparison-based sorting?

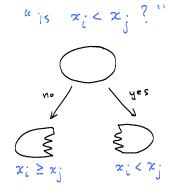

Each comparison ("is $\chi_i < \chi_j$?")

partitions the set of possible Solutions

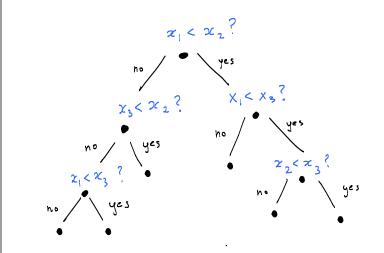

into two sets: those in which $\chi_i < \chi_j$ and those in which $\chi_i \geq \chi_j$,

and the answer eliminates one of the two sets.

Suppose the input is of size n. There are n! possible orderings. "Sorting" means figuring out which one.

Example: Sort $(x_1 x_2 x_3)$

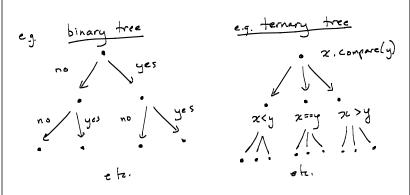

$\begin{array}{c} \chi_{1} \times \chi_{2} \times \chi_{3} \\ \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{1} \\ \chi_{3} \times \chi_{2} \times \chi_{3} \times \chi_{1} \\ \chi_{3} \times \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{1} \\ \chi_{3} \times \chi_{2} \times \chi_{3} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{3} \times \chi_{1} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$ $\begin{array}{c} \chi_{1} \times \chi_{3} \times \chi_{2} \\ \chi_{2} \times \chi_{3} \times \chi_{2} \end{array}$

"Decision Tree"

Each (non-leaf) vertex is a question.

The children of each vertex are the answers.

For the problem of serting n numbers $\{x_1, x_2, \dots, x_n\}$, any comparison based sorting algorithm defines a binary decision tree with n! leaves.

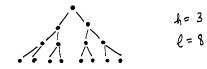

example:

n=3

Jole:

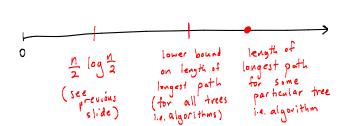

- · tree depends on n and on algorithm
- one leaf per problem instance
 path length = number of comparisons

The worst case (max number of questions) is the length of the longest path in the decision tree, i.e. the height h of the tree, Clain (easy to see)
Suppose a binary tree of height h has I leaves. Then, l = 2t. Equivalently, log_l = h

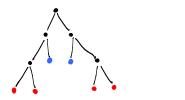

For comparison based sorting of n elements, the "worst case" requires at least $\frac{n}{2} \log \frac{n}{2}$ Comparisons.

i.e. the worst case is Il (n log n).

For any algorithm and hence, for any decision tree, the best/worst/average case in terms of number of comparisons is the Shortest / longest / average path length in the decision tree.

For any comparison - based sorting algorithm, the decision tree has 2 = n! leaves. Thus, the length of the longest path (height of tree) > log(n!) = log(n.(n-1)(n-2).... 1) $> \log \left(\frac{n}{2} \cdot \frac{n}{2} \cdot \dots \cdot \frac{n}{2} \cdot \left(\frac{n}{2} - 1 \right) \left(\frac{n}{2} - 2 \right) \cdot \dots \cdot 2 \cdot 1 \right)$ n times $> \frac{n}{2} \log \frac{n}{2}$ (lower bound on length of longest path)

lecture 21

- lower bound for comparison-based Sorting algorithms

- linear time sorting (not comparison-- counting sort bucket sort
- more probability (independent events)

Linear time sorting algorithms impose more constraints on the input . range of values (e.g. "counting sort")

· probability of elements

(e.g. "bucket sort")

Counting Sort

Suppose inputs $\chi_1 \chi_2 - \chi_n$ are integers in range $\{1, 2, ..., r\}$ and we allow for repeating elements.

Claim:

We can sort the $\chi's$ in time and space O(n+r).

e.g. if r=n, then we can sort in time O(n).

for i = | to r count[i] = 0for j = | to n count[x[j]] + tfor i = | to r for k = | to count[i]print i

What is the disadvantage of countsort?

For many problems:

• r is very large e.g. sorting students by 1D number

• the x[] might not be integers. e.g. double, string Suppose we have n doubles x_i in [0,1)where j=1 to n.

We consider intervals $\left[\frac{i-1}{n}, \frac{i}{n}\right]$ where i = 1, ... n $\left[\begin{array}{c} \sum_{n=1}^{\infty} \frac{1}{n} \\ \sum_{n=1}^{\infty} \frac{1}{n} \end{array}\right]$

Put each x; into its interval / bucket.

Then sort the elements in each bucket.

The worst case is that all n of the X; will go into the same bucket. If we use an $O(n^2)$ algorithm for sorting, then bucketsort is $O(n^2)$. The power of bucketsort (similar to hashing) comes from the assumption about the input, namely:

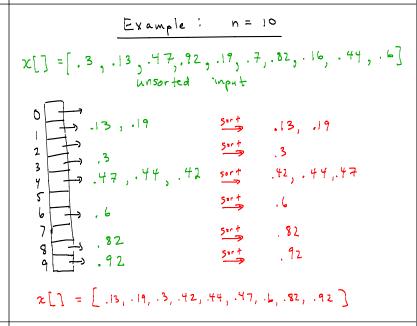

Assume each X; is equally likely to fall in any of the buckets.

for i = 1 to n bucket [i] = empty list for j = 1 to n { add z[j] to bucket [floor (z[j]* n)] } for i = 1 to n { Sort bucket [i] // insertion sort print out sorted bucket [i]

Claim: if each z; is equally likely to go into any bucket, then the expected running time of bucket sort is O(n).

Note: here we are considering random in puts, not a randomized algorithm.

buckets (linked lists) This is similar to a Hash Set data structure (array of linked lists) except here there is no hash function.

Proof:

Consider any particular bucket i.

Define random variables:

$$B_{ij} = \begin{cases} 1, & \text{if } z_j \text{ falls in bucket } i. \\ 0, & \text{otherwise} \end{cases}$$

$$N_i = \sum_{j=1}^{n} B_{ij}$$
 the number of x_j in bucket i.

$$\begin{array}{lll} & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$$

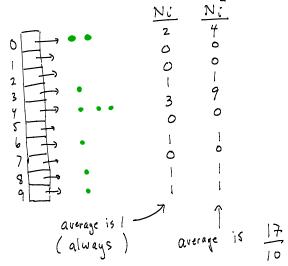

Suppose we use
$$N_i^2$$
 operations to sort the elements in bucket j . (e.g. insertion sort)

Then bucketsort uses
$$O(n + \sum_{i=1}^{N} N_i^2)$$

putting elements sorting the into buckets

 $O(n + \sum_{i=1}^{N} N_i^2)$

What is
$$\xi \sum_{i=1}^{n} N_i^2$$
?

$$E Ni^{2} for any i = 1 to N$$

$$= \int_{k=0}^{2} k^{2} Pr(N_{i} = k)$$
one can show (using tools from MATH 323, namely Ni has binomial distribution)
$$A = \int_{k=0}^{2} k^{2} Pr(N_{i} = k)$$

Thus,
$$\mathcal{E} \sum_{i=1}^{n} N_i^2 = \sum_{i=1}^{n} \mathcal{E} N_i^2 < 2n$$

Thus, buckefsort has expected running time $O(n)$

Next class ... data compression.

Today one final thing ...
a bit more probability

Independent Events

Definition: Given a sample space S and a probability distribution P, two events E_1 and E_2 are independent if $P(E_1 \land E_2) = P(E_1) \cdot P(E_2)$.

ASIDE: In a proper course on probability,

(eg. MATH 323) the definition of "independent

event" is based on the definition of

something called "conditional probability".

I believe that going into the

details here would be a distraction.

Instead, I ask you to rely on your

intuition (dangerous!) in judging that

a set of events is "independent" and to

to apply the definition on the previous slide

Example

Suppose we flip a fair coin twice.

Let E, be the event that the first toss was a fail/tail \(\gamma \text{00}, \text{01} \) \(\gamma \text{00}, \text{01} \) \(\gamma \text{00}, \text{01} \) \(\gamma \text{100}, \text{01} \) \(\gamma \text{00}, \text{10} \) \(\gamma \text{100}, \text{100} \) \(\gamma \text{100} \) \(\gamma \text{100}, \text{100} \) \(\gamma \text{100}, \text{100} \) \(\gamma \text{100}, \text{100} \)

Example (two slight variations)

Suppose we flip an unfair coin twice.

Let E, be the event that the first toss was a fail/tail 900,013.

Let E2 be the event that the second toss was a head/success: $\{01,11\}$.

Now, E, Λ E2 = $\{01\}$ "E, and E2 are independent" means $P(E_1 \land E_2) = P(E_1) \cdot P(E_2) = P_0(1-P_0)$

Recall from lecture 19:

Let X be the number of coin tosses

until we get a success.

The coin tosses are Independent:

Pr (X=i)

= p(fail on tosses 1 to i-1) p(success on toss i)

= p(fail on toss 1) p(fail on toss 2).

p (fail on toss i) p(fail on toss 2).

p (fail on toss i) p(success on toss i)

i p (fail on toss i).

What is the expected number of coin tosses of an unfair coin until we get a success?

$$E(X) = \sum_{i=1}^{\infty} i Pr(X = i)$$

$$= \sum_{i=1}^{\infty} i Po(1 - po)$$

$$= \sum_{i=1}^{\infty} i Po(1 - po)$$

$$= \sum_{i=1}^{\infty} i Po(X = i)$$

$$= \sum_{i=1}^{\infty} i Pr(X = i)$$

$$= \sum_{i=1}^{\infty} i Po(1 - po)$$

$$= \sum_{i=1}^{\infty} i Po(1 -$$

We will return to this Scenario next class when we discuss "run length coding".

Exercise: think what happens when po > 0, \frac{1}{5}, 1.
